

E ENJO Precision Products specializes in the research, development and manufacturing of high performance and professional racing parts. With over 20 years of experience in the performance industry, ENJO has built a reputation for producing only the highest quality products.

Racing is at the heart of all new developments at ENJO. The knowledge gained from endless hours of track testing has guaranteed that its products will perform under even the most demanding conditions.

Engine Mounts

The ENJO Precision Products – Platinum Series engine swap mount kits provide precise, 100% bolt-on installation for many popular engine swap applications, while offering sufficient hood and power steering clearance. Formed from top grade steel, which absorbs and transfers power, these mounts are laser-cut and jig-welded to ensure proper fitment. Following a

21-step quality control program, the lightweight mounts are e-coated, then powder-coated in silver for maximum durability and robotically mig-welded for high quality consistency. ENJO-engineered polyurethane inserts offer firm support, while minimizing vibration. All engine mounts are capable of handling up to 700whp and are backed by a limited lifetime warranty.

Transmission Mounts

The ENJO Precision Products – Platinum Series engine swap transmission mount kits provide easy bolt-on installation for various transmissions including the Honda Civic, Honda del Sol and Acura Integra. The production of the tranny mounts feature similar specs as the engine mounts and they are built under the same guidelines: top grade steel, laser cut, jig welded, 21-step quality control, etc. A variety of mounts are currently available, ranging from cable-to-hydraulic and hydraulic-to-cable applications for the Honda Civic, del Sol and Acura Integra.

Drive Shafts

The ENJO Precision Products product line features upgraded drive shafts for a variety of Honda / Acura applications. Capable of handling 300hp, 500hp or 700hp, ENJO drive shafts can be used in most B, H, or K-series setups. Assembled under a 28-step quality control program and using only the highest quality materials (such as high temperature neoprene or silicone boots, chromoly constant velocity joints and aerospace high tensile stainless steel bands), ENJO drive shafts offer unsurpassed reliability while still preserving everyday drivability. All ENJO Precision Products drive shafts are specifically designed to handle the extreme levels of abuse caused by high horsepower forced induction applications under race conditions and are track-tested and proven to perform on the street and in various forms of racing, such as road, rally and drag racing.
